

Anchor tag: <a>

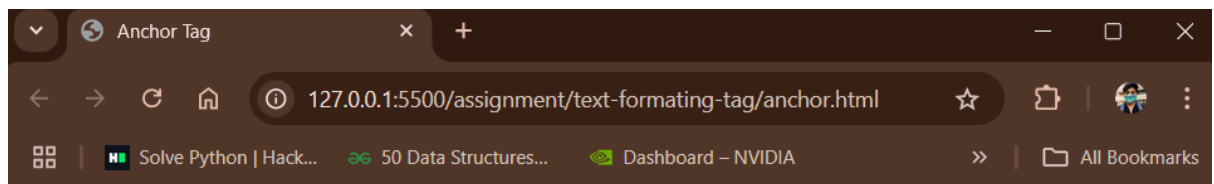

It is used to define hyperlinks. It allows user to navigate to different web pages or download something.

href: (hyperlink reference)

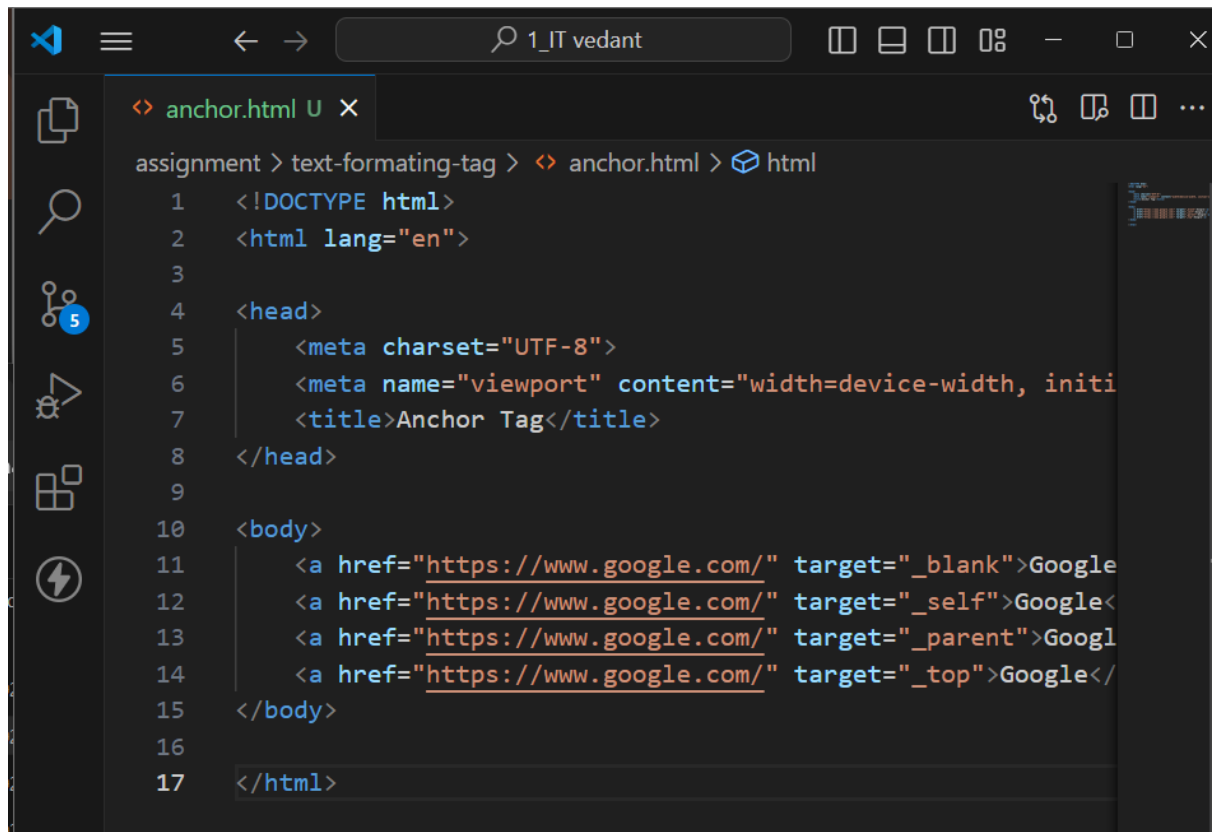

here we have to specify the url of the desired page. After that we have to write the text that we want to display to the users and user can click on that text to navigate.

target: Specify where to open the link

- **_self:** (default) – opens in the same tab
- **_blank:** open in new tab
- **_parent:** open in parent tab
- **_top:** opens in the full body of the window

[Google](#)

The image shows a code editor window with a dark theme. The top bar includes a search icon, a menu icon, and a search input field containing '1_IT vedant'. The editor has a sidebar on the left with icons for Explorer, Search, Source Control, Run and Debug, and Testing. The main editor area shows a file named 'anchor.html' with the following HTML code:

```
1 <!DOCTYPE html>
2 <html lang="en">
3
4 <head>
5     <meta charset="UTF-8">
6     <meta name="viewport" content="width=device-width, initial-scale=1.0">
7     <title>Anchor Tag</title>
8 </head>
9
10 <body>
11     <a href="https://www.google.com/" target="_blank">Google</a>
12     <a href="https://www.google.com/" target="_self">Google</a>
13     <a href="https://www.google.com/" target="_parent">Google</a>
14     <a href="https://www.google.com/" target="_top">Google</a>
15 </body>
16
17 </html>
```
