

Position and Float

Position property:

The position property specifies how an element is positioned in the document and defines the positioning behavior of that element relative to its containing block or other elements.

Value	Description
Static (default)	The element is positioned according to the normal document flow.
relative	The element is positioned relative to its normal position.
absolute	The element is positioned relative to the nearest positioned ancestor.
fixed	The element is positioned relative to the viewport.
sticky	The element toggles between relative and fixed, depending on the scroll position.

Float:

The float property is used to position elements to the left or right of their container, allowing text or other inline elements to wrap around them.

left: The element floats to the left of its container

right: The element floats to the right of its container

none: Does not float (default).

Inherit: The float value is inherited from its parent.
